The start of Meteorological summer saw an extensive anticyclone off the west coast of Ireland extending east over the UK with a cool northerly flow down across the country. More unsettled conditions prevailed across central and eastern parts of Europe but we enjoyed clear skies and light to moderate northerly winds across the islands through the 1st, albeit with air temperatures just a shade below average, topping out at just 16°C.

Cloud within the general circulation occasionally took the edge off our sunshine but that high maintained its influence until later on the 3rd, before easing back westward to allow a series of fronts to drop down over the UK and giving rise to a scattering of light showers for the afternoon of the 4th. The low responsible for these fronts was centred just off the east coast of Iceland as its fronts cleared south into Brittany so our skies brightened by dawn on the 5th with a continuation of this rather cool airflow.

As the low filled and that Atlantic anticyclone re-exerted its influence from the west, clear skies and light winds overnight into the 6th saw air temperatures dip to just 9.3°C by dawn. Thickening cloud brought a few light showers to our shores that morning but they cleared to the southeast by midday to leave us with a fine afternoon. The ridge continued to extend into the Southwest Approaches for the 7th as well, and despite some weak weather fronts skirting to the north of the islands we enjoyed another fine day but again temperatures a tad below average at just 16°C. Those same weak fronts finally edged into the Channel during the course of the morning of the 8th with a few spots of rain but skies cleared readily through the afternoon as those fronts cleared to the southeast.

That mid-Atlantic high maintained its influence across the islands for the 9th as well, but it was still a cool northwesterly flow, and despite some 14.7 hours of recorded sunshine we managed only 16.9°C up at the airport. A more active cold front made progress south across the UK overnight into the 10th as a small low ran down the North Sea to be centred near the Dover Straits by dawn. The associated front yielded 0.3mm of rain from just after dawn to around mid morning, the first recordable rainfall amount this month. Again, clearing skies by noon brought excellent visibility across the islands, but still a tad on the cool side.

High pressure once again filled in across the UK with a return to clearer but slightly cooler conditions for the next few days. By the end of the 12th that high had slipped away to the south, allowing a series of Atlantic fronts to paint a more unsettled look to the charts. Cloud thickened from the west during the morning of the 13th, with rain nudging in slowly to arrive early that afternoon. Thankfully the cloud base stayed high enough for a successful Air Display off St Peter Port, with the rain arriving just as the show finished.

Jersey Met Office rain radar showing an advancing band of rain just before noon on the 13th

That rain became persistent through the afternoon, mixing with drizzle and mist through the evening before clearing in the early hours of the 14th. A few light showers rolled up the Channel around dawn before becoming more widely scattered that afternoon and evening as the low centred itself off the northwest coast of Scotland with a fresh southwesterly flow across the islands. This pattern continued through the 15th with further blustery showers and it wasn't until late morning on the 16th that conditions started to improve as that low filled and eased away over the North Sea.

It was a brief respite however, as the next low out in Biscay started to develop and push northeast across northern France. The associated fronts extended up into the Channel sufficiently to give us rain by late evening on the 17th which cleared the next morning with just a few residual showers that afternoon. Our winds had eased off too and veered into the north but air temperatures still reluctant to climb much above the mid teens.

With high pressure extending a ridge up across central and northern parts of the UK from the southwest, and shallow low pressure over Biscay and France, we settled into a run of northeasterly winds for the next couple of days with dry, bright, pleasant conditions with temperatures reaching 19.0°C on the 20th. That high slipped away southward by the 21st however, allowing an active cold front to sweep in from the west as low pressure once again brought another spell of unsettled weather to our shores. That front arrived mid evening with rain turning to drizzle overnight with mist and hill fog at times before clearing to the east well before dawn on the 22nd. Drier and brighter conditions prevailed for the rest of the day as a transient ridge stretched up from France but a quasi-stationary front out in the Southwest Approaches introduced cloud thick enough for some patchy rain and drizzle through the small hours of the 23rd and the residual cloud shield only cleared the islands later on that afternoon. Much warmer air was being pulled in from the south as well, with air temperatures nudging up into the low 20's.

An extensive belt of lower cloud affected the Bailiwick from late on the 23rd and it wasn't until some 24 hours later that we saw it drift slowly away to the northwest late afternoon on the 24th. Light winds off the nearby Continent again helped temperatures climb rapidly by day as we enjoyed a rather pleasant, warm and settled spell of weather. Four consecutive days from the 23rd to the 26th saw air temperatures exceed 20°C with a maximum figure of 25.0°C reached during the afternoon of the 26th. The 25th also recorded 15.0 hours of sunshine, the sunniest day locally since 15th July 2022.

Low pressure off the northwest coast of Ireland was starting to affect the UK by the 26th, with a series of fronts making their way across the UK and down into the Channel. A rather weakened cold front arrived locally late morning on the 27th with low cloud, mist and some patchy drizzle affecting the islands before clearing to the southeast by early afternoon. Early evening saw the best of the sunshine but with a cooler, fresher, westerly flow now coming in off the Atlantic, temperatures were back to more seasonal levels around the mid to high teens. That low tracked eastward to the north of Scotland during the 28th but with a ridge building from the Azores we enjoyed a peasant day on the 29th with light winds, although extensive high cloud made the sunshine a tad hazy at times.

Weak fronts arrived in the local area around mid morning on the 30th, with cloud rapidly thickening and lowering leading to mist and hill fog patches together with some patchy drizzle. The offending front cleared shortly after midday but the sun was reluctant to make an appearance until later that afternoon, but at least we closed out the month on a bright note.

After a cool first half of the month, temperatures picked up for the last couple of weeks resulting in a mean temperature for the month marginally above the long term average, although it was the coolest June for 8 years. At just 13.9mm of rain it was the driest June since 2018 with 15 days through the month with no rainfall recorded. At 305.7 hours of sunshine this was the sunniest June for 10 years and only the 4th time this century that this month has exceeded 300 hours of sunshine. Mid morning on the 30th saw the only period of fog at the airport making this the least foggy June, equal with 1975, since records began at the airport.
